## problem 3b

## Simplyfying LHS

Prove  $\sqrt{\sec^2 \theta + \csc^2 \theta} = (\tan \theta + \cot \theta)$

$$LHS \Rightarrow \sqrt{\sec^2 \theta + \csc^2 \theta} \quad (6)$$

$$\Rightarrow \sqrt{\frac{1}{\sin^2 \theta} + \frac{1}{\cos^2 \theta}} \quad (7)$$

$$\Rightarrow \sqrt{\frac{\sin^2 \theta + \cos^2 \theta}{\sin^2 \theta \times \cos^2 \theta}} \quad (8)$$

$$\Rightarrow \sqrt{\frac{1}{\sin^2 \theta \times \cos^2 \theta}} \quad (9)$$

$$\Rightarrow \sqrt{\sec^2 \theta \times \csc^2 \theta} \quad (10)$$

$$\Rightarrow \sec \theta \times \csc \theta \quad (11)$$

## Solution

Let's divide the equation into 2 parts those are LHS and RHS and lets simplyfy both LHS and RHS and find their simplyfied value if both are same then statement is true if not then false

What we know before starting proof are

on simplyfying LHS we got

$$LHS = \sec \theta \times \csc \theta \quad (12)$$

$$\sin^2 \theta + \cos^2 \theta = 1 \quad (1)$$

$$\sec \theta = \frac{1}{\cos \theta} \quad (2)$$

$$\csc \theta = \frac{1}{\sin \theta} \quad (3)$$

$$\tan \theta = \frac{\sin \theta}{\cos \theta} \quad (4)$$

$$\cot \theta = \frac{\cos \theta}{\sin \theta} \quad (5)$$

## Simplyfying RHS

$$RHS \Rightarrow \tan \theta + \cot \theta \quad (13)$$

$$\Rightarrow \frac{\sin \theta}{\cos \theta} + \frac{\cos \theta}{\sin \theta} \quad (14)$$

$$\Rightarrow \frac{\sin^2 \theta + \cos^2 \theta}{\sin \theta \times \cos \theta} \quad (15)$$

$$\Rightarrow \frac{1}{\sin \theta \times \cos \theta} \quad (16)$$

$$\Rightarrow \sec \theta \times \csc \theta \quad (17)$$

we may use these equations in simplyfying RHS ans LHS

on simplyfying RHS we got

$$RHS = \sec \theta \times \csc \theta \quad (18)$$

## conclusion

$$when(\sec \theta \times \csc \theta > 0) \quad (19)$$

based on eq(12),eq(18) and if eq(19) is true then and we will get down equation

$$LHS = RHS = \sec \theta \times \csc \theta \quad (20)$$

$$\therefore \sqrt{\sec^2 \theta + \csc^2 \theta} = (\tan \theta + \cot \theta)$$

**Hence Proved**
